**Nomenclatures:**

CF	Conflat™ by Varian Corp.
EDPM	Ethylene Propylene Diene Monomer
FFKM	Perfluoroelastomer (Kalrez or Chemraz)
FKM	Fluoroelastomer (Viton)
HV	High Vacuum
LV	Low (rough) Vacuum
MV	Medium Vacuum
OFHC	Oxygen-Free High Conductivity™
UHV	Ultra-High Vacuum

## **1. INTRODUCTION**

The European Spallation Source (ESS) is an accelerator-driven neutron spallation source. The linear accelerator (LINAC) of which is a critical component. The role of the accelerator is to create protons at the ion source, accelerates them to an appropriate energy, and steers them onto the target to create neutrons via the spallation process for use by a suite of research instruments.

## **2. SCOPE**

The ESS Vacuum Handbook comprises four (4) parts:

ESS Vacuum Handbook Part 1 – General Requirements for the ESS Technical Vacuum Systems,

ESS Vacuum Handbook Part 2 – Vacuum Equipment Standardization,

ESS Vacuum Handbook Part 3 – Vacuum Design & Fabrication, and

ESS Vacuum Handbook Part 4 – Vacuum Test Manual

Part 4 provides guidelines, and imposes requirements where necessary, for the tests associated with the vacuum systems of the Accelerator, Target and Neutron Instruments. The VH is applicable to all vacuum components and systems exposed to a technical vacuum environment.

This VH will be periodically updated throughout the life of the ESS project.

All queries or additional information concerning the contents of this handbook should be addressed to the ESS Vacuum Group Section Leader (VGL).

## **3. TEST PROCEDURES**

### **3.1 Visual inspection**

This is a general inspection to ensure that the quality of workmanship of the vessel or component etc., from a vacuum prospective, is sound and that it shows no deterioration or damage has occurred during fabrication, handling or transport etc. that will impact vacuum performance.

### **3.2 Leak Testing**

#### **3.2.1 Preparation for testing**

All equipment used to conduct vacuum leak testing is to be approved and inspected by ESS VG prior to use. The use hydrocarbon free dry pumping is preferred, alternatively equipment which is suitably trapped to avoid the potential for contamination, due to back streaming of oil maybe used.

The Mass Spectrometer Leak Detector (MSLD) used for leak testing shall be calibrated as per ISO 3530 (Mass-spectrometer-type leak detector calibration). If an

**Description: ESS Vacuum Handbook Part 4**

Document No 0.1

Date 11 January 2019

internal calibrated leak is used then this must be traceable to an external calibrated leak calibrated against a traceable standard.

Vessels and assemblies must be cleaned and vacuum baked (if specified) as appropriate by methods approved by ESS VG prior to testing, refer to the relevant sections of the VH.

Leak testing is to be conducted in accordance with the requirements of SS-EN 1779.

### **3.2.2 Testing Requirements**

#### *3.2.2.1 UHV Systems and Components*

Where applicable all connections between the vessel under test and the vacuum pump must be made using metal seals. When connecting the vessel and carrying out these tests take care must be taken to ensure that the cleanliness of the vessel is maintained. This is of particular concern for vacuum assemblies and components installed adjacent to the superconducting cavities of the LINAC where particulate contamination is a major concern.

The total acceptable leak rate for the vessel shall be  $<10^{-9}$  Pa m<sup>3</sup> s<sup>-1</sup> ( $<10^{-10}$  mbar l s<sup>-1</sup>) using an open probe method and  $<10^{-8}$  Pa m<sup>3</sup> s<sup>-1</sup> ( $<10^{-9}$  mbar l s<sup>-1</sup>) when the chamber is completely bagged and filled with helium (>95% concentration) for a period of >10 minutes and tested using a MSLD peak to a sensitivity  $<10^{-11}$  Pa m<sup>3</sup> s<sup>-1</sup> ( $<10^{-12}$  mbar l s<sup>-1</sup>), unless another value has been specified in the contract or other technical documentation or agreed in writing with ESS VGL.

#### *3.2.2.2 High Vacuum Systems and Components*

Where applicable all connections between the vessel under test and the vacuum pump should be made using metal seals or the sealing type used on the component in its final configuration when performing the final helium leak test. When connecting the vessel and carrying out these tests take care must be taken to ensure that the cleanliness of the vessel is maintained.

All fabricated parts shall be helium leak tested and show no detectable leak  $>10^{-7}$  Pa m<sup>3</sup> s<sup>-1</sup> ( $>10^{-8}$  mbar l s<sup>-1</sup>) when tested using a MSLD peak to a sensitivity  $<10^{-9}$  Pa m<sup>3</sup> s<sup>-1</sup> ( $<10^{-10}$  mbar l s<sup>-1</sup>).

#### *3.2.2.3 Rough Vacuum Systems and Components*

Where applicable all connections between the vessel under test and the vacuum pump should be made using the sealing type used on the component in its final configuration when performing the final helium leak test. When connecting the vessel and carrying out these tests take care must be taken to ensure that the cleanliness of the vessel is maintained.

All fabricated parts shall be helium leak tested and show no detectable leak  $>10^{-6}$  Pa m<sup>3</sup> s<sup>-1</sup> ( $>10^{-7}$  mbar l s<sup>-1</sup>) when tested using a MSLD peak to a sensitivity  $<10^{-8}$  Pa m<sup>3</sup> s<sup>-1</sup> ( $<10^{-9}$  mbar l s<sup>-1</sup>).

### **3.2.3 Notification of Testing**

Leak testing of large vessels or assemblies are to be witnessed by a member of ESS VG before acceptance for delivery to ESS unless otherwise agreed with the VG.

**Description: ESS Vacuum Handbook Part 4**

Document No 0.1

Date 11 January 2019

At least 3-week notice shall be given prior to the conducting of off-site testing.

### **3.2.4 Reporting of Leak Test Results**

Proof of vacuum test results are required for all leak tests performed to demonstrate that the acceptance criteria have been met. A test report shall be submitted using the "Leak Test Report" form attached as Appendix A. together with other leak test documentation to the VG for review and approval prior to shipment for delivery to ESS.

Any initial component failure and subsequent corrective action shall be documented as part of the Leak Test Report.

Any proposed deviation from this procedure, or alternative specifications, shall be submitted to ESS, in advance, for review and approval.

### **3.3 Outgassing Rate Test**

#### **3.3.1 Preparation for testing**

The requirement to performance an "Outgassing Rate Test" will be specified prior to manufacture by the VG.

The total out-gassing rate of a vessel or assembly shall be measured after 10 hours of pumping from atmosphere. The measured outgassing rate shall be  $<10^{-9} \text{ Pa m}^3 \text{ s}^{-1}$  ( $<10^{-10} \text{ mbar l/s cm}^2$ ).

A hydrocarbon free dry pumping unit and a Residual Gas Analyser (RGA) must be used for these tests. The RGA is to be calibrated against a special gas mixture containing 4 gases species e.g. He, N<sub>2</sub>, Ar and Ne [ratio 5:60:20:15 respectively] using the ISO 20175.

#### **3.3.2 Testing Requirements**

The mass spectrum over the mass range of 1-100 u is to be recorded after 10 hours of pumping from atmosphere.

The "hydrocarbon" content, recorded by the RGA, must not exceed 10% of the maximum allowable outgassing rate. This can be calculated by summing all the hydrocarbon peak heights  $>40 \text{ u}$  and expressing them as a fraction of the total peak height. From the total measured outgassing rate.

The outgassing rate due to hydrocarbon (HC) is to be calculated as follows:

Hydrocarbon outgassing (%) =  $\text{Sum of HC peaks} / \text{sum of all peaks} \times \text{measured outgassing rate}$

Peaks at 17, 18, 28 and 40 u are deemed to be non-hydrocarbon.

#### **3.3.3 Notification of Outgassing Rate Tests**

Outgassing tests on large vessels or assemblies are to be witnessed by a member of ESS VG before acceptance for delivery to ESS unless otherwise agreed with the VG.

At least 3 week notice shall be given prior to the conducting of off-site testing.

**Description: ESS Vacuum Handbook Part 4**

Document No 0.1

Date 11 January 2019

**3.3.4 Reporting of RGA Test Results**

A printout from the RGA is required to demonstrate that the acceptance criteria have been met. This printout shall be submitted with other leak test documentation to the VG for review and approval prior to shipment for delivery to ESS.

**4. APPLICABLE DOCUMENTS**

In the case of conflict, with the requirements stated in this VH, the VH shall take precedence. If the requirements of the VH are in conflict with Legislation and/or Regulations then these conflicts are to be brought to the attention of the VGL for resolution.

The following documents form a part of the ESS Vacuum Handbook Part 4 – Vacuum Test Manual.

Document	Description
ISO 3530	Vacuum technology – Mass-spectrometer-type leak detector calibration.
ISO 20175	Vacuum technology - Characterization of quadrupole mass spectrometers for partial pressure measurement
SS-EN 1779	Non-destructive testing - Leak testing - Criteria for method and technique selection.

## 5.2 Units

This document uses the SI system to express units, however other deviations are mentioned accordingly.

Symbol	Unit
m	metre
g	gram
s	second
A	ampere (electric current) [C s <sup>-1</sup> ]
K	kelvin (temperature)
mol	Mole
J	joule (energy) [N m]
W	watt (power) [J s <sup>-1</sup> ]
N	newton (force) [m g s <sup>-2</sup> ]
Pa	pascal (pressure) [N m <sup>-2</sup> ]
V	volt (electrical potential) [W A <sup>-1</sup> ]
°C	degree Celsius (temperature) [K] *no-SI unit
bar	bar (pressure) [Pa] *no-SI unit (defined by IUPAC)
l	litre (volume) [m <sup>3</sup> ] *no-SI unit
C	conductance [m <sup>3</sup> s <sup>-1</sup> ; l <sup>3</sup> s <sup>-1</sup> ]
u	unified atomic mass *no-SI unit
